DECLARATION UNDER 37 CFR § 1.131(a)

Sir:

I, Richard Sammis Bergen, Jr., an applicant in the above-identified patent application,
declare as follows:

1. I worked on the subject matter of the above-identified application ("the
Invention") in the United States on behalf of BellSouth Corporation ("BellSouth").
2. Prior to March 16, 1995, BellSouth had performed propagation testing and
system level testing of Local Multipoint Distribution Service (LMDS) in the United States.
3. Exhibit 1 shows a test point overlay with 126 points that were generated using
a statistically random distribution. The test point overlay shown in Exhibit 1 was placed on
maps in regions being tested to locate 126 test points. The test points were located in the

4. A diagram of LMDS field test equipment is shown in Exhibit 2. The LMDS field test equipment includes a node or cell site and Customer Premise Equipment (CPE). The node shown in this diagram performed one-way FM video broadcast or simultaneous one-way digital video broadcast and bi-directional telephony via a T-1 line. The CPE was capable of FM video reception or simultaneous digital video reception and bi-directional telephony. The testing with the equipment shown in Exhibit 2 occurred in the United States prior to March 16, 1995.

5. A diagram of the architecture for LMDS station equipment is shown in Exhibit 3. The LMDS station equipment architecture shown in Exhibit 3 was used in testing the node part of LMDS and this testing occurred in the United States prior to March 16, 1995. As shown in this diagram, the node included a multi-media multiplexer connected to a plurality of sources, such as MPEG-1, MPEG-2, and JPEG Encoder. The node also included a QPSK modulator having an input connected to the multi-media multiplexer and having an output connected to an RF transmitter ("RF XMIT").

6. A diagram of the architecture for LMDS CPE station equipment is shown in Exhibit 4. The LMDS CPE station equipment architecture shown in Exhibit 4 was used in testing the CPE part of LMDS and this testing occurred in the United States prior to March 16, 1995. As shown in this diagram, the LMDS CPE station equipment included a QPSK demodulator for receiving signals from an RF receiver ("RF RCVR"). Data from the QPSK demodulator was supplied to a multi-media demultiplexer which then forwarded data to a JPEG decoder and to a PC which provided MPEG video and audio to a picture-in-picture

Atty. Docket No. 36968/172908

(PIP) television. An output from the multi-media demultiplexer is represented as a two-way T1 line that was routed to a fax machine, a PC, and to a Plain Old Telephone Services ("POTS") telephone.

7. Exhibit 5 is a photograph of an LMDS fixed node transceiver used in the testing that occurred in the United States prior to March 16, 1995.

8. Exhibit 6 is a photograph of an LMDS CPE transceiver used in the testing that occurred in the United States prior to March 16, 1995.

9. Results of testing that was performed in the United States prior to March 16, 1995, confirmed (1) FM video downstream; (2) Digital video downstream with either JPEG real time encoding at 20 Mbps or pre-recorded MPEG-1 video at 1.544 Mbps with full menu control over an upstream channel; (3) switched telephony and Fax services over D4 channel banks (T1 line and multiple CPE POTS lines); and (4) Interactive games and data transfer at 512 Kbps.

10. Exhibit 7 is a summary of measured and computed data gathered during testing that occurred in the United States prior to March 16, 1995.

11. Results of testing that was performed in the United States prior to March 16, 1995, confirmed (1) T1 telephony; (2) video transmission (both JPEG and MPEG); (3) simultaneous execution of telephony operations (voice and data transmission, LAN bridging) and video transmission; and (4) line-of-site transmission at 16 or more kilometers.

12. Exhibit 8 is a summary of baseline tests that were conducted in the United States prior to March 16, 1995, on the data gathered during testing.
